

Introduction to CSS — Quick Reference

CSS Syntax

- `selector { property: value; }`

Three Ways to Add CSS

- Inline — `style="color: red;"` — **on one element**
- Internal — `<style>...</style>` in `<head>` — **styles the whole page**
- External — `<link rel="stylesheet" href="style.css">` — **styles every linked page**

Selectors

- Tag — `h1 { ... }` — **every `<h1>` on the page**
- Class — `.highlight { ... }` + `class="highlight"` — **group, reusable**
- ID — `#special { ... }` + `id="special"` — **one element, not reusable**

Color Properties

- `color` — **text color**
- `background-color` — **background color**

Ways to Write a Color

- Keyword — `red`
- Hex — `#ff0000`
- RGB — `rgb(255, 0, 0)`

Inline vs. Block Elements

- Block — e.g. `<div>` — **new line, full width**
- Inline — e.g. `<span>` — **sits in text flow, content width; width/height ignored**
