

Building a Portfolio

Boilerplate, text, lists, links, images & forms, together at last — Personal Portfolio Worksheet

Name: _____ Section: _____ Date: _____

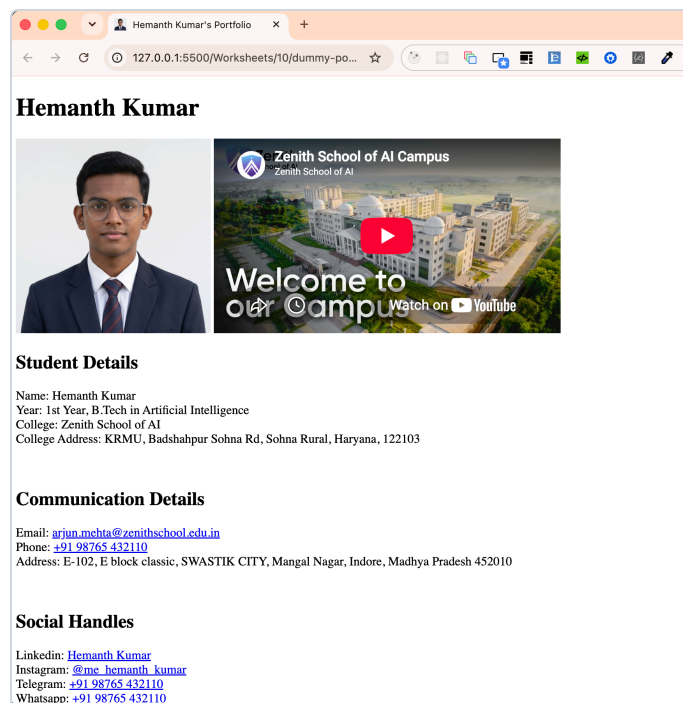

How to use this sheet: Keep **VS Code**, your **browser**, and the **reference screenshots** below open side by side. Build your portfolio page, checking your output in **Live Server** as you go.

Concept — Putting it all together. Over the past few classes you've learned the HTML **boilerplate, headings & paragraphs, text formatting** tags, **semantic vs. non-semantic** tags, **block vs. inline** elements, **lists** (ordered, unordered), **links, images, iframes** and **forms**. Today you'll use all of it at once to build your own **personal portfolio page**.

Fun fact. Search for "Andrew Ng original homepage Stanford" to see what his personal homepage looked like a few years back — plain HTML, no CSS, and it still did its job. **Don't compare your page to a live portfolio site** — those rely on a lot of CSS, which is exactly what we'll add in the next few classes.

Reference — Target Portfolio

Refer to the four screenshots below and recreate a similar portfolio page for yourself — same sections, your own content.

CLASS WRAP-UP • GIT + GITHUB PAGES

Push `index.html` (and your photo, if any) to your GitHub repository:

```
git add .
git commit -m "Personal portfolio page"
git push
```

Confirm it opens correctly on your **GitHub Pages** live link.

Live link: Write your GitHub Pages URL here once it's confirmed working.
