

Collaboration & Git — Quick Reference

Core Git Workflow

1. `git clone <repository-url>` — copy a repo locally
2. `git status` — see what changed
3. `git add .` — stage changes
4. `git commit -m "message"` — save a snapshot
5. `git push origin main` — upload to GitHub
6. `git pull origin main` — download latest changes
7. `git log` — view commit history

Key Terms

- **Repository** — project folder + full history
- **Commit** — a saved snapshot
- **Staging Area** — where `git add` puts changes before a commit
- **Clone** — download a copy of a repo
- **Push** — upload commits to GitHub
- **Pull** — download latest commits from GitHub

Create a Private Repo

1. github.com → log in → **New Repository**
2. Name it → select **Private**
3. Create the repository

Add a Collaborator

1. Settings → Collaborators
2. Add people → enter their GitHub username
3. They accept the invite (email/GitHub notification)

Team Turn Order

1. `git pull` before you start
2. Make your edits
3. `git add . && git commit -m "..."`
4. `git push`, then tell the next teammate
